

Notes:

- Hide password in input field
- Make sure to fill in placeholders for edit fields
- Problems deploying w react
 - A line in app.js → /dist (or something) → add a post build script
 - Use create react app (then google deploy to heroku)
- Check if itinerary is undefined? Throw 404 if undefined
- Open hours:
 - Be clear in redesign for open hours table reasoning
 - Took points off for not having primary key
- Async in frontend
 - 404 errors (fetching data vs rendering components)
 - Handle: callbacks → within api request, use success value to make another request
- Redesign
 - Don't have to redo wireframes
 - Talk about why app is not just CRUD
- Cookies vs sessions
 - Make a request from client to server
 - Sessions useful when you want to perform an action → check to see if expired or not
 - Server can't talk to client
 - Cookie saved in local storage
 - Should automatically logout after a set amount of time
 - Set expiration time for cookies/session
 - Is there a default?
 - Check APIs
- **Think about Mon vs Wed meeting time and let her know by end of day**
